

The capstone: writing, reviewing and defending your one-page AI (artificial intelligence) project brief

Walked through in Session 6, Saturday 26 September 2026; hard deadline Saturday 10 October 2026. Project pack plus videos V58 to V60. Student edition.

Student edition: the questions are here; the answers are discussed in the session.

Questions: Because of the interpretation delay, please send your questions in the Zoom chat, or better, after the session on the WhatsApp number you already have.

The interactive exercises live in the professor's edition and are shown on screen during the session. Each one is described here, with every control, its range and what it stands for.

Block 1 of 4

What you hand in, and when

Project pack

10 minutes

One page, four sections, an evaluation matrix behind it, two reviews written, one table of responses: four dates, one hard deadline.

In this block: the one idea, a story, three things to keep, three questions, your turn, and three things from the block. All 10 pages of the project pack are in the professor's edition.

Pages from the project pack

PACK page 1: The one-page AI project brief

PACK page 2: What you hand in, and when

PACK page 6: The timeline, day by day

Block 1 The one idea

The capstone is one page that a stranger could check, plus the evidence that you checked it yourself and let two other people check it too.

What is the capstone not?

Not a report, not a model, not code, not a description of an algorithm. A ten-page document with a model attached is off the mark twice: too long to be a brief, and built before the problem was agreed.

the word: **project brief**

What is it?

One page with four sections, written to be read cold. Underneath, the justification in four parts. Attached, the evaluation matrix as the evidence, and after the reviews, the response table showing what you changed and why.

the word: **peer review**

Draft on 1 October, two reviews written by 4 October, revision by 8 October, final on 10 October. The last date does not move.

PACK page 6: The timeline, day by day

The company that banned slides in its own meetings, 2004

Step 1

A meeting culture built on slides

By 2004 the senior team at Amazon, like most companies, opened its meetings with slide presentations: bullet points, a speaker, and a room trying to listen, read and think at the same time.

Step 2

The email, 9 June 2004

Jeff Bezos writes to the senior team: no more slide presentations. In their place, well structured narrative text. The reason he gives is that writing a good memo is harder, and that the difficulty is the point.

Step 3

Four to six pages, in full sentences

The memo has to say what is more important than what, and how the parts connect. Bullet points, he argued, give permission to gloss over ideas and to flatten everything to the same weight.

Step 4

Meetings start in silence

Everyone reads the memo at the table before anyone speaks, sometimes for half an hour. The document has to work with nobody present to explain it.

Step 5

What it asks of the writer

The practice has lasted two decades. The lesson for your brief is the same one: a page that has to be read cold, by someone who cannot ask you a question, is the strictest test of whether the thinking is finished.

Three things to keep

1

Four things travel: the brief, the matrix, two review forms you write, and the response table.

2

Four dates: 1, 4, 8 and 10 October. The last one is a hard deadline.

3

The brief is written for a reader who cannot ask you anything.

Customer project pack

What you hand in, and when

1	2	3	4
Thursday 1 October Draft brief, one page, four sections. Will your evaluation matrix be attached as evidence?	Sunday 4 October Two peer reviews written and received, using the brief, four criteria, at least two suggestions made.	Wednesday 8 October Revised brief, with the response to reviewer table showing what changed and why.	Saturday 10 October Final brief submitted for grading. Final deadline. Is this after Session 6?

The envelope on 10 October

1. The brief, one page, four sections.
2. The evaluation matrix, that meets, clear, intelligibility, cited, related to the evidence before it.
3. The response to reviewer table, every comment you received, what level it was, what you did about it.

How it is graded

Clarity of problem framing. Quality of reasoning. Use of the correct terminology. Demonstrable integration of the peer feedback you received. The rubric on page 5 spells out what each level looks like.

Week 1 Learning and 4 in Business - Topic 10-10

Customer project pack

The timeline, day by day

Date	What happens	What you send or receive
Sunday 20 September	Session 6: the response envelope. Choose your problem if you have not yet.	Nothing yet.
Sunday 27 to Wednesday 30 September	While they draft. Day the one sentence image to someone who knows the business.	Draft in progress.
Thursday 1 October	Draft deadline. Two classmates receive your brief, you receive two.	You send, draft brief plus evaluation matrix.
Friday 2 to Saturday 3 October	Read the two briefs out, one each. 10 in the form, a draft for each criteria, at least two suggestions made.	Revisions in progress.
Sunday 4 October	Peer reviews deadline.	You send two review forms, you receive two.
Monday 5 to Tuesday 7 October	Get each comment, clarity or substance. Decide: accept, accept in part, or reject each evaluation. Revise.	Response table in progress.
Wednesday 8 October	Revision deadline.	You send, revised brief plus response table.
Saturday 10 October	Final submission. Hard deadline.	You send, final brief, matrix, response table.

Week 1 Learning and 4 in Business - Topic 10-10

Project pack, page 2 of 10

PACK page 6: The timeline, day by day

Customer project pack

Submission checklist: before you press send

☐ The brief is one page. Nothing is on page this except the attachments.	☐ Section 1 names a prediction, a population, a window and a decision with an issue.
☐ Section 2 names the matrix that will, with period and location, and what is still missing.	☐ Section 3 has a table, and the measure follows the cost of the two errors.
☐ Section 4 names the decision before in business terms, and one intelligent.	☐ The algorithm is justified underneath, in four parts, with one required observation.
☐ The evaluation matrix is attached, clear, intelligibility, cited, what, which.	☐ The response to reviewer table is attached, one row per comment received.
☐ Every comment has a kind and a decision, and every decision has a reason.	☐ The file name carries your name and the date.

Hard deadline: Saturday 10 October 2020. Draft on 1 October, two peer reviews by 4 October, revision by 8 October.

Week 1 Learning and 4 in Business - Topic 10-10

Project pack, page 6 of 10

PACK page 10: Submission checklist: before you press send

Block 1 Question 1 of 3

A student plans to write the brief on the evening of 9 October, submit it on the 10th, and skip the peer reviews because the final is what is graded.

What is wrong with that plan?

A

Nothing. Only the final submission is graded.

B

The grade includes the integration of the feedback received, and there is no feedback without a draft on 1 October and two reviews written by 4 October.

C

The brief must be longer than one page, which takes more than an evening.

D

Peer reviews are optional, but the draft is compulsory.

40 seconds

Type the letter in the Zoom chat

The answer is discussed in the session.

Date	What happens	What you send or receive
Saturday 26 September	Session 6: the capstone workshop. Choose your problem if you have not yet.	Nothing due.
Sunday 27 to Wednesday 30 September	Write the draft. Say the one-sentence scope to someone who knows the business.	Draft in progress.
Thursday 1 October	Draft deadline: Two classmates receive your brief; you receive two.	You send: draft brief plus evaluation matrix.
Friday 2 to Saturday 3 October	Read the two briefs cold, once each. Fill in the form: a level for each criterion, at least two suggestions each.	Reviews in progress.
Sunday 4 October	Peer reviews deadline.	You send two review forms; you receive two.
Monday 5 to Tuesday 7 October	Sort each comment: clarity or substance. Decide: accept, accept in part, or rebut with evidence. Revise.	Response table in progress.
Wednesday 8 October	Revision deadline.	You send: revised brief plus response table.
Saturday 10 October	Final submission. Hard deadline.	You send: final brief, matrix, response table.

Machine Learning and AI in Business Cyber Skills

Project pack, page 6 of 10

PACK page 6: The timeline, day by day

A draft brief is one page of four sections. Under the sections it names gradient boosting, states an F1 score of 0.81, and stops. Nothing is attached.

What is missing from the envelope?

- A

A second page describing the algorithm in more detail.
- B

The justification in four parts with a rejected alternative, and the evaluation matrix attached as evidence.
- C

A list of the team members.
- D

Nothing. The score shows the model works.

40 seconds

Type the letter in the Zoom chat

The answer is discussed in the session.

PACK page 3: The four sections, and the test each one has to pass

PACK page 2: What you hand in, and when

It is Monday 5 October. A student has received two review forms with eleven comments between them and has three evenings before the revision is due.

What is the first thing to do with the eleven comments?

A Change the brief to satisfy all eleven, in the order received.

B Sort each comment by kind, clarity or substance, and decide for each whether to accept, accept in part, or rebut with evidence, before touching the brief.

C Ignore the ones from the reviewer who scored lower.

D Rewrite the brief from a blank page.

40 seconds

Type the letter in the Zoom chat

The answer is discussed in the session.

Response-to-reviewer table: what changed, and why

Every comment you received gets a row. The table goes with the revised brief on 8 October and with the final on 10 October. It is how the grade sees that the feedback was heard.

No.	Comment received (in the reviewer's words)	Kind	Decision	What changed, and where in the brief
1.	"Which 18 months? Say the dates."	Clarity	Accept	Section 2 now reads "April 2025 to September 2026, in the dispatch system"
2.	"The expensive error here is the false alarm, no recall alone will not protect you."	Substance	Accept in part	Section 3 adds a precision fear of 60% next to the recall target of 60%, with the cost of a call stated.
3.	"Use a neural network; it will be more accurate."	Substance	Rebut, with evidence	No change. 18 months of tabular records is too small, and the dispatchers must read the reason for each flag. Stated under the justification.
4.				

Three decisions are possible: accept and change, accept in part, or rebut with evidence. A rebuttal is a legitimate answer when it is argued; silence is not.

Machine Learning and AI in Business Cyber Skills Project pack, page 8 of 10

PACK page 8: Response-to-reviewer table: what changed, and why

Block 1 Your turn

Your turn: plan the fourteen days

Pick your start day and your hours. The four dates are fixed; the planner says which of them holds.

What you can move on screen

Day you start the draft Sunday 27 September, Monday 28 September, Tuesday 29 September, Wednesday 30 September

The first evening you sit down to write.

Hours the draft needs from 2 hours to 10 hours, in steps of 1

Writing, plus one conversation with someone who knows the business.

Hours you can give each day from 0.5 hours to 3 hours, in steps of 0.5

The same figure is used for every day up to the deadline.

Hours per review you write from 0.5 hours to 2 hours, in steps of 0.5

Reading a brief cold once, then filling in the form. Two reviews.

Try, in this order

1. As it opens: start on 27 September, six hours of drafting, one hour a day. Read whether the draft holds.
2. Move the start to 30 September. One hour a day is no longer enough; see which date fails first.
3. Raise the hours per day until every date holds again, and note how many hours that is.

The point: The dates do not move, so the only thing that can move is when you start. Every day you wait raises the hours per day that the plan needs.

The draft is written on the days before 1 October, the reviews on 2 and 3 October, and the revision on 5, 6 and 7 October, set here at three hours. The dates are the course's; the hours are yours.

Three things from this block

1 One page, four sections, the justification underneath, the matrix attached.

2 Draft 1 October, reviews 4 October, revision 8 October, final 10 October.

3 The grade reads the whole road: draft, reviews given, feedback integrated, final.

PACK page 10: Submission checklist: before you press send

PACK page 2: What you hand in, and when

PACK page 6: The timeline, day by day

Block 2 of 4

Build one brief together

Project pack

12 minutes

A made-up courier company, a real sum, and the four sections filled in one at a time.

In this block: the one idea, a story, three things to keep, three questions, your turn, and three things from the block. All 10 pages of the project pack are in the professor's edition.

Pages from the project pack

PACK page 9: Worked example: a courier's failed first deliveries

PACK page 4: Scoping checklist: is this a problem worth writing up?

PACK page 3: The four sections, and the test each one has to pass

Start from the decision that changes, not from the data you happen to have.

“We waste a fortune on parcels nobody is home to receive. Can AI (artificial intelligence) fix our failed deliveries?” A goal, a complaint and a technology. Nothing yet that a model could be built against.

Predict, for each parcel booked for tomorrow, whether the first delivery attempt will fail, for home deliveries in the metropolitan region, so that the dispatch desk calls the flagged customers the evening before.

Then the sum: a repeated attempt costs about \$12, a call ahead about \$0.80. Fifteen to one, so recall leads and precision is the floor.

Worked example: a courier's failed first deliveries

1 TASK TYPE

Read the text and decide for each sentence whether the first delivery was successful or not. Write *successful* or *failed* in the space provided.

2 DATA

Read the text and complete the table below. Write the date, time and place of the delivery, and whether it was successful or not. Write *successful* or *failed* in the space provided.

3 SUCCESS MEASURE

Read the text and decide for each sentence whether the first delivery was successful or not. Write *successful* or *failed* in the space provided.

4 MAIN REASON

Read the text and decide for each sentence whether the first delivery was successful or not. Write *successful* or *failed* in the space provided.

Complete project pack

Scoping checklist: is this a problem worth writing up?

Three traits (V56)		Four pitfalls	
Surrounding you at the outset	Which decisions changes when the problem arises, and who makes them?	The lead ahead	Two years in gestation, 30 to 80 days is a prediction.
Enough history of the context quality	How many months of context. When a problem arises what is the pattern you see?	Prediction: ideas for the project	It is a small chance, a pattern decision what is done about the risk.
The team works	What if it goes into three years, against what the model says to build on?	State you cannot have	Privacy law, information and access decide when the project does.
		Anything at all	One prediction for two, then another.
Four elements of the statement			
Problem history, or what you are responding, so that decisions, and what takes it		Before you write, say the statement to someone who listens the business, or not, and what happens	
		here? the scope is not fixed.	

Assessment project paper				
The rubric: four criteria, four levels				
Criterion	Level 1	Level 2	Level 3	Level 4
Quality of problem framing	A goal, or a question, or a problem, is stated.	A goal/question is mentioned but not clearly stated.	One problem/question, one evidence, one solution are stated.	Two problems/questions and two evidence/solutions are stated.
Feasibility of data availability	Whether or not records are available.	Records are noted, but no one knows if records are or are not available.	Records that will, with general and routine, be available.	Records that will, with some hard-to-get but not hard-to-get records, be available.
Appropriateness of the chosen measures	No number, or accuracy, or a time scale, or a unit of the metric.	A number, but the measure does not have a unit or a scale, or the unit of the metric.	A number and a measure that has a unit and a scale.	A number and the measure is stated in the chosen the measure, at least 1 time scale, and 1 unit (e.g. degree).
Quality of the identification	Whether or not the work is identified.	Whether or not the work is identified in the literature.	Whether or not the work is identified in the literature, and how it was done.	Whether or not the work is identified in the literature, and how it was done, and the source.

PACK page 5: The rubric: four criteria, four levels

The prize that defined the task down to two decimal places, 2006 to 2009

Step 1

A wish: better recommendations

In 2006 Netflix, then a DVD-by-post company, wants its recommendation system to guess more accurately how a customer will rate a film. As a goal, that sentence cannot be tested.

Step 2

The task, with a threshold and a prize

It publishes about 100 million past ratings, names one measure of error, and offers one million dollars to the first team that reduces that error by 10% against its own system. One prediction, one data set, one number.

Step 3

Three years of work

Tens of thousands of teams enter. Yearly progress prizes reward the best result so far. Because the task is exactly defined, every entry can be scored the same way.

Step 4

The winner, September 2009

A combined team clears the threshold at 10.06% and takes the prize. The winning entry is a blend of more than a hundred separate models.

Step 5

The part that was never used

Netflix did not put the winning blend into production: the gain did not justify the engineering cost, and the business was moving to streaming. Even a perfectly scoped task still has to pass the sum.

Three things to keep

1

Scope first: one prediction, one population, one window, one decision with an owner.

2

Data second: records that exist, a period, a location, an answer field, and the named gap.

3

Measure and risk from the costs: which error is expensive decides the measure and the safeguard.

Customer project pack

Scoping checklist: is this a problem worth writing up?

Three traits (V50)	Four pitfalls
Randomly onto or the record Which decision changes when the prediction arrives, and why does it?	Too far ahead Ten years in past/present, 30 to 60 days in a prediction
Enough history of quality quality How many months of records, from a period when the action was taken?	Prediction taken for the decision The model scores, a person decides what is done about the score.
The team works Value of the gap over three years, against what the model score is held against.	Does your current have Policy (law, selection rules and action) decide what the project does.
Four elements of the statement Predict which [population] will [prevent] when [predicted], so that [decision], and who takes it?	Everything at once One prediction first, prove it, then extend.

Before you write, say the statement to someone who knows the business. If they say "What customers?" or "What happens if?" or "What happens if?" the scope is too limited.

PACK page 4: Scoping checklist: is this a problem worth writing up?

Customer project pack

Worked example: a courier's failed first deliveries

1 TASK TYPE Predict the next period based on previous, whether the first delivery attempt will be for categories, both or successfully, to have delivered by the next period again.	Why this passes the tests History and prediction, one prediction, a one day window, a decision with an owner (the courier's data).
2 DATA Courier history (18 months of delivery records in the courier's system, April 2020 to September 2020, about 1.5 million attempts, most with the address recorded. Among the records, only for the first delivery attempt, or about a third of the records, two weeks of data to 60 days after the first.	Basic records Basic records the data, a period, a location, an answer field, and a named gap with a test in it.
3 SUCCESS MEASURE First of all, predict this on failed first attempts, with prediction of how often, of every 100 attempts, at least 10% of the records have failed, so at least 40% of all are made for testing. A measured attempt score about 0.2, and about 0.25 to 0.3.	Measure the score Measure the score with 0.2 and for the first 100 days, then in one, the model score and prediction is the first that keeps the data available. Make the history data is important, and the relevant score in day one.
4 RISK ASSESS Once again, the first day, no testing changes. Subsequent the higher periods are added by the courier's data the morning before, on the first, and the first day is to be tested again.	Justification underneath Justification underneath, a prediction history on the 1.5 million records, a prediction history on a single period, a prediction history on the first day, and the first day is to be tested again. The figure in this example are made up for testing.

PACK page 9: Worked example: a courier's failed first deliveries

Customer project pack

The four sections, and the test each one has to pass

1 Task type What does the model predict, and on what basis the categories, the number or the period.	2 Data What exists today, what is it, and what exists tomorrow, and under the same conditions, the same data is to be tested.	3 Success measure How good is good enough, as a measure, and the test of each kind of error tested in it.	4 Risk The most likely way this fails, in a morning, and the safeguard that follows from it.
Test type The test type can be used to test the model's prediction.	Test type The test type can be used to test the model's prediction.	Test type The test type can be used to test the model's prediction.	Test type The test type can be used to test the model's prediction.

PACK page 3: The four sections, and the test each one has to pass

Block 2 Question 1 of 3

For the courier, one student writes section 1 as: reduce failed deliveries across the network using machine learning.

Which element of the scoped statement is missing?

A

Only the population.

B

All four: there is no prediction, no population, no window and no decision.

C

Only the time window.

D

Nothing. Reduce failed deliveries is a clear task.

40 seconds

Type the letter in the Zoom chat

The answer is discussed in the session.

Pages from the project pack

Customer project pack

Worked example: a courier's failed first deliveries

1 TASK TYPE

Predict, for each parcel booked for tomorrow, whether the first delivery attempt will fail (two categories: fails or succeeds), for home deliveries in the metropolitan region.

2 DATA

Exists today: 18 months of delivery records in the dispatch system, April 2020 to September 2020, about 1.6 million attempts, each with the outcome recorded. Missing: the reason code for the failure is empty in about a third of the records; two weeks of work to fill it from driver notes.

3 SUCCESS MEASURE

Recall of at least 80% on failed first attempts, with precision of at least 60%; of every 100 parcels flagged, at least 60 would really have failed, so at most 40 calls are made for nothing. A repeated attempt costs about \$12; a call ahead costs about \$0.80.

4 MAIN RISK

Drivers ignore the flag list, so nothing changes. Safeguard: the flagger prints are called by the dispatch desk the evening before, not by the driver, and the desk's call log is reviewed weekly.

Why this passes the tests

Framing: one prediction, one population, a one-day window, a decision with an owner (the dispatch desk).

Data: records that exist, a period, a location, an answer field, and a named gap with a cost in time.

Measure: the miss costs \$12 and the false alarm \$0.80, fifteen to one, so recall beats and precision is the floor that keeps the calls affordable.

Risk: the likeliest failure is organisational, and the safeguard exists on day one.

Justification underneath: gradient boosting on the 1.6 million tabular records, no explanation required for a single parcel; a readable model was rejected because the desk acts on the list, not on the reason. The figures in this example are made up for teaching.

Machine Learning and AI in Business - Cyber Skills

Project pack, page 9 of 10

PACK page 9: Worked example: a courier's failed first deliveries

Customer project pack

Scoping checklist: is this a problem worth writing up?

Three traits (V59)

Somebody acts on the output Which decision changes when the prediction arrives, and who owns it?

Enough history of usable quality How many months of records, from a period when the pattern was stable?

The sum works Value of the gain over three years, against what the model costs to build and run.

Four elements of the statement

Predict which [population] will [event] within [window], so that [decision, and who takes it].

Four pitfalls

Too far ahead Two years is guesswork; 30 to 90 days is a prediction.

Prediction taken for the decision The model scores, a person decides what is done about the score.

Data you cannot have Privacy law, retention rules and access decide before the project does.

Everything at once One prediction first, prove it, then extend.

Before you write: say the statement to someone who knows the business. If they ask "which customers?" or "what happens then?", the scope is not finished.

Machine Learning and AI in Business - Cyber Skills

Project pack, page 4 of 10

PACK page 4: Scoping checklist: is this a problem worth writing up?

Block 2 Question 2 of 3

The courier's records: 1.6 million delivery attempts over 18 months, each with the outcome recorded, and the reason for failure empty in about a third of them.

How should section 2 treat the missing reason codes?

A

Leave them out of the brief; the outcome field is enough.

B

Name them as the gap, with the cost of filling it: about two weeks of work from the driver notes.

C

Promise that the model will infer the missing reasons.

D

Delete the third of the records that lack a reason.

40 seconds

Type the letter in the Zoom chat

The answer is discussed in the session.

Why this passes the tests

Framing: one prediction, one population, a one-day window, a decision with an owner (the dispatch desk).

Data: records that exist, a period, a location, an answer field, and a named gap with a cost in time.

Measure: the miss costs \$12 and the false alarm \$0.80, fifteen to one, so recall beats and precision is the floor that keeps the calls affordable.

Risk: the biggest failure is organisational, and the safeguard exists on day one.

Justification underneath: gradient boosting on the 1.6 million tabular records, no explanation required for a single parcel; a readable model was rejected because the desk acts on the list, not on the reason. The figures in this example are made up for teaching.

Machine Learning and AI in Business - Capstone Skills

Project pack, page 9 of 10

PACK page 9: Worked example: a courier's failed first deliveries

Capstone project pack

The rubric: four criteria, four levels

Criterion	Level 1	Level 2	Level 3	Level 4
Clarity of problem framing	A goal, or a technology, in place of a prediction.	A prediction is named but the population or the window is missing.	One prediction, one population, one window, one decision.	Level 3, and the decision owner and the action are named, so a stranger could describe one view of the output.
Plausibility of data availability	Wishes, no records named.	Records named, but no period, no location, or no answer field.	Records that exist, with period and location, and what is still missing.	Level 3, and the cost or time of filling the gap is stated, with any access barrier named.
Appropriateness of the success metric	No number, or accuracy on a rare outcome.	A number, but the measure does not follow the cost of the errors.	A number and a measure chosen from the cost of the two errors.	Level 3, and the tolerance is stated in counts (for example, at most 8 false alarms in 1000 attempts).
Quality of risk identification	"The model may not work."	A risk is named, but not in business terms.	The most likely failure, who pays for it, and how it shows.	Level 3, and a safeguard that exists in the first version.

Levels 1 to 4 add to a self-check score out of 16. The first grade is set by the instructor on the four course dimensions: clarity of framing, quality of measuring, use of the course frameworks, and integration of the peer feedback. If the scoring in the university's Final Project document differs from this page, that document takes precedence.

Machine Learning and AI in Business - Capstone Skills

Project pack, page 5 of 10

PACK page 5: The rubric: four criteria, four levels

Block 2 Question 3 of 3

A repeated delivery attempt costs about \$12 and a call ahead about \$0.80. A student sets the courier's measure as precision of at least 95%, so that almost no call is wasted.

What is the problem with that measure?

A

95% is impossible to reach.

B

It protects against the cheap error. At fifteen to one the expensive error is the missed failure, so recall should lead, with precision as a floor.

C

Precision is never a valid measure.

D

The measure should be accuracy, because it covers both errors.

45 seconds

Type the letter in the Zoom chat

The answer is discussed in the session.

Pages from the project pack

Capstone project pack

Worked example: a courier's failed first deliveries

1 TASK TYPE

Predict, for each parcel booked for tomorrow, whether the first delivery attempt will fail (two categories: fails or succeeds), for home deliveries in the metropolitan region.

2 DATA

Exists today: 18 months of delivery records in the dispatch system, April 2020 to September 2020, about 1.6 million attempts, each with the outcome recorded. Missing: the reason code for the failure is empty in about a third of the records; two weeks of work to fill it from driver notes.

3 SUCCESS MEASURE

Recall of at least 80% on failed first attempts, with precision of at least 60%; of every 100 parcels flagged, at least 60 would really have failed, so at most 40 calls are made for nothing. A repeated attempt costs about \$12; a call ahead costs about \$0.80.

4 MAIN RISK

Drivers ignore the flag list, so nothing changes. Safeguard: the Region parcels are called by the dispatch desk the evening before, not by the driver, and the desk's call log is reviewed weekly.

Why this passes the tests

Framing: one prediction, one population, a one-day window, a decision with an owner (the dispatch desk).

Data: records that exist, a period, a location, an answer field, and a named gap with a cost in time.

Measure: the miss costs \$12 and the false alarm \$0.80, fifteen to one, so recall leads and precision is the floor that keeps the calls affordable.

Risk: the likeliest failure is organisational, and the safeguard exists on day one.

Justification underneath: gradient boosting on the 1.6 million tabular records, no explanation required for a single parcel; a readable model was rejected because the desk acts on the list, not on the reason. The figures in this example are made up for teaching.

Machine Learning and AI in Business - Cyber Skills

Project pack, page 9 of 10

PACK page 9: Worked example: a courier's failed first deliveries

Capstone project pack

The four sections, and the test each one has to pass

1

Task type

What does the model predict, and for whom? Name the categories, the number or the groups.

Test: a stranger can say what one row of the answer looks like.

Red flag: a goal in place of a prediction.

2

Data

What exists today, where it sits, which period it covers, and whether the past cases carry the answer. Then what is still missing.

Test: every record named could be opened in memory.

Red flag: values instead of records.

3

Success measure

How good is good enough, as a number, with the cost of each kind of error behind it.

Test: a cost for mislabel every week with a chart.

Red flag: no numbers.

4

Main risk

The most likely way this fails, in business terms, and the safeguard that follows from it.

Test: someone could tell on it before the first error.

Red flag: 'performance may dip'.

The brief deliberately does not name the algorithm. The justification for the algorithm and for the measure goes underneath the four sections, in four short parts: the choice and why, the measure and the cost difference behind it, the trade-offs accepted, and a plain-language summary.

Machine Learning and AI in Business - Cyber Skills

Project pack, page 3 of 10

PACK page 3: The four sections, and the test each one has to pass

Your turn: do the courier's sum

The worked example with your numbers. Failures, calls and repeated attempts are counted per day and priced per month.

What you can move on screen

Home deliveries a day from 2000 to 10000, in steps of 500

How many first attempts the region makes each day.

Share that fail first time from 5% to 20%, in steps of 1

Today's failure rate, before any model.

Cost of a repeated attempt from \$5 to \$25, in steps of 1

The expensive error: a failure nobody was warned about.

Cost of a call ahead from \$0.2 to \$2, in steps of 0.2

The cheap error: a call to a customer who would have been home.

Recall on failures from 40% to 90%, in steps of 5

Of the parcels that would fail, the share the model flags.

Precision on flags from 30% to 90%, in steps of 5

Of the parcels flagged, the share that would really have failed.

Try, in this order

1. As it opens: 5,000 deliveries, 12% failing, recall 80%, precision 60%. Read the monthly saving.
2. Drop precision to 30%. The calls double and the saving falls, but it holds. That is why precision is a floor here and not the lead.
3. Raise the call to \$2 and lower the repeat to \$5. The ratio collapses; watch the saving shrink and ask which measure would lead now.

The point: Trait three is a sum you can do on one slide. Do it before you write the measure, because the ratio it produces is what chooses the measure.

The courier's figures are invented for teaching. A call ahead is assumed to turn a failed first attempt into a successful one, and a month is 25 working days.

Three things from this block

1

Start from the decision and its owner, then work back to the prediction.

2

The data section has two halves, and the second half has a cost.

3

The cost ratio chooses the measure; write the ratio next to it.

PACK page 9: Worked example: a courier's failed first deliveries

PACK page 10: Submission checklist: before you press send

PACK page 3: The four sections, and the test each one has to pass

How it is graded

8 minutes

Four criteria, four levels each, and a self-check you can run on your own draft before anyone else reads it.

In this block: the one idea, a story, three things to keep, three questions, your turn, and three things from the block. All 10 pages of the project pack are in the professor's edition.

Assessment project paper				
The rubric: four criteria, four levels				
Criterion	Level 1	Level 2	Level 3	Level 4
Clarity of problem framing	A goal or a wish, in a technology or a field of a profession	A proposition is mentioned but the proposition is not clear	One proposition, one or several propositions, are written down	One proposition, and the decision maker and the actor are named, as a stronger proposition, as well as the impact
Feasibility of data availability	Nothing, or no search needed	A proposition is mentioned, but no answer is available, or no answer found	Reasons that will, with general and concrete, and with a convincing argument	One proposition, and the actor and the actor's role are named, as a stronger proposition, as well as the impact
Appropriateness of the business context	No mention, or irrelevance of a business context	A number, but the business context is not taken into account	A number and the business context, but the context of the actors	A number, and the business context, and the actor and the actor's role are named, as a stronger proposition, as well as the impact
Quality of the identification	Nothing, or the question is not such a question	A question is mentioned, but the question is not clear	A question and the business context, but the context of the actors	A question, and the business context, and the actor and the actor's role are named, as a stronger proposition, as well as the impact

PACK page 5: The rubric: four criteria, four levels

Timeline project path

What you hand in, and when

Thursday 1 October

- Book and edit your writing, with your evaluation mark attached in advance

Friday 4 October

- Turn your notes together and returned using the form (see criteria, at the end of the assignment sheet)

Wednesday 9 October

- Submit your writing, with the response to seminar slide showing and corrected and signed

Saturday 12 October

- Final hand in to be graded hand deadline, 10 days after session 5

The envelope on 10 October

- 2. The level, one page, four sections.
- 2. The evaluation sheet, two rows, data, interpretability, and cited in the evidence listed 5.
- 3. The response to review sheet, one page required, and one page you don't attend 4.

How it is graded

Clarity of problem framing. Quality of reasoning. Use of the course materials. Demonstration of insight of the year. Evidence you know the rules. The rules on page 1 and page 4 of each level book.

PACK page 2: What you hand in, and when

Submission checklist: before you press send

- ☐ The brief is on one page. Nothing on page two except the appendix.
- ☐ Section 1 names a prediction, a population, a window and a decision with an answer.
- ☐ Section 2 shows a linear, or binary, and the measure follows the four of the two errors.
- ☐ Section 3 names the likelihood failure in business, terms, and one subgoal.
- ☐ The evaluation matrix is attached, date, interpretability, cost, and one subgoal.
- ☐ Every comment has a kind and a decision, and every decision has a kind.
- ☐ Section 4 names a prediction, a population, a window and a decision with an answer.
- ☐ Section 5 shows a linear, or binary, and the measure follows the four of the two errors.
- ☐ The algorithms is justified underwritten, in pairs, with one repeated alternative.
- ☐ The response-to-viewer table is attached, one row per comment received.
- ☐ The file name carries your name and the date.

Hard deadline: Saturday 20 October 2020. Draft on 1 October, peer reviews by 4 October, revision by 9 October.

PACK page 10: Submission checklist: before you press send

A rubric turns “is this good?” into four questions with four answers each, and any reader gets the same answer.

Without a rubric

“It reads well.” “Section 2 feels thin.” Two reviewers, two impressions, and nothing the author can act on. The draft gets a feeling back instead of a list.

the word: **rubric**

With the rubric

Framing 3, data 1, measure 2, risk 2. The weakest line is the data section, and level 3 says exactly what it needs: records that exist, a period, a location, and the gap. The author knows what to do next.

the word: **level**

The self-check score is out of 16 and it is yours. The grade is the instructor's, on clarity of framing, quality of reasoning, use of the frameworks, and integration of the feedback.

Customer project pack

The rubric: four criteria, four levels

Criterion	Level 1	Level 2	Level 3	Level 4
Clarity of problem framing	A problem is mentioned in passing, in plain language.	A problem is mentioned in passing, in plain language.	One problem, with the author's own words, is mentioned in passing.	Level 3, and the decision maker and the author are clear, in language, what the problem is and what the goal is.
Plausibility of data availability	Where, no records are mentioned.	Records are mentioned, but no period, no location, and no gap is mentioned.	Records that exist, with period and location, and what is still missing.	Level 3, and the goal is clear, in language, what the goal is, and the author is clear, in language, what the goal is, and the author is clear, in language, what the goal is.
Appropriateness of the measures used	No number, or accuracy, or time, or location, or gap is mentioned.	A number, but the decision maker and the author are not clear, in language, what the goal is, and the author is not clear, in language, what the goal is.	A number and a measure, chosen for the goal, and the author is clear, in language, what the goal is, and the author is clear, in language, what the goal is.	Level 3, and the decision maker and the author are clear, in language, what the goal is, and the author is clear, in language, what the goal is.
Quality of risk identification	The reader may not know the risk.	A risk is named, but not in the business context.	The reader may know the risk, but not in the business context.	Level 3, and a significant risk exists in the business context.

Levels 1 to 4 is a self-check score out of 16. The first guide is early in the decision maker and the author are clear, in language, what the goal is, and the author is clear, in language, what the goal is. The second guide is early in the decision maker and the author are clear, in language, what the goal is, and the author is clear, in language, what the goal is. The third guide is early in the decision maker and the author are clear, in language, what the goal is, and the author is clear, in language, what the goal is. The fourth guide is early in the decision maker and the author are clear, in language, what the goal is, and the author is clear, in language, what the goal is.

Project pack page 3 of 10

PACK page 7: Peer review form: one per brief you review

The score that replaced a feeling in the delivery room, 1952

Step 1

Before 1952

A newborn was assumed to be well unless something was obviously wrong. Internal trouble, with breathing or circulation, could be missed in the first minutes, when it mattered most.

Step 2

Five things, scored 0, 1 or 2

Virginia Apgar, an anaesthesiologist at Columbia University, proposes five observations: heart rate, breathing, muscle tone, reflexes and colour. Each is scored 0, 1 or 2. The total runs from 0 to 10.

Step 3

One minute and five minutes after birth

The score is taken at fixed times, so two babies, or the same baby twice, can be compared. Published in 1953, it was in use around the world within years.

Step 4

Anyone in the room can do it

No instrument, no specialist. A nurse, an intern or a midwife gives the same score, and a low score triggers action on the spot instead of a discussion.

Step 5

What it changed

It is still the standard. The lesson for a rubric is the same: name the criteria, define the levels, fix when the score is taken, and any reader can apply it to any draft.

Three things to keep

1 Four criteria: framing, data, measure, risk. Four levels each.

2 Level 3 is specific. Level 4 is specific and justified.

3 Score your own draft before you send it; the weakest line is your first job.

PACK page 5: The rubric: four criteria, four levels

PACK page 10: Submission checklist: before you press send

PACK page 2: What you hand in, and when

Block 3 Question 1 of 3

Section 3 of a draft reads: at least 92% precision on emails flagged urgent, chosen because a wrongly escalated email costs an agent ten minutes while a missed urgent email costs a customer.

Which level does the measure reach on the rubric?

A

Level 1: there is no number.

B

Level 2: a number, but the measure ignores the cost of the errors.

C

Level 3: a number and a measure chosen from the cost of the two errors.

D

Level 4: level 3, and the tolerance stated in counts.

40 seconds

Type the letter in the Zoom chat

The answer is discussed in the session.

PACK page 5: The rubric: four criteria, four levels

Capstone project pack

The four sections, and the test each one has to pass

1

Task type
What does the model predict, and for whom? Name the categories, the number or the groups.
Test: a stranger can say what one row of the answer looks like.
Red flag: a goal in place of a prediction.

2

Data
What exists today, where it sits, which period it covers, and whether the past covers carry the answer. Then what is still missing.
Test: every record named could be named in theory.
Red flag: wishes instead of records.

3

Success measure
How good is good enough, as a number, with the cost of each kind of error behind it.
Test: it can be calculated every week with a count.
Red flag: no number.

4

Main risk
The most likely way this fails, in business terms, and the safeguard that follows from it.
Test: someone could act on it before the first error.
Red flag: "performance may improve".

The brief deliberately does not name the algorithm. The justification for the algorithm and for the measure goes underneath the four sections, in four short parts: the choice and why, the measure and the cost difference behind it, the trade-offs accepted, and a plain-language summary.

Machine Learning and AI in Business Cyber Skills Project pack, page 3 of 10

PACK page 3: The four sections, and the test each one has to pass

Block 3 Question 2 of 3

A student scores their own draft 14 out of 16 and asks whether that means an A.

What is the honest answer?

A

Yes. The rubric score is the grade.

B

No. The self-check finds the weakest section; the grade is set by the instructor on four course dimensions, including how the peer feedback was integrated.

C

No, because self-scores are always too high.

D

Yes, if two reviewers agree with the score.

40 seconds

Type the letter in the Zoom chat

The answer is discussed in the session.

Response-to-reviewer table: what changed, and why

Every comment you received gets a row. The table goes with the revised brief on 8 October and with the final on 10 October. It is how the grade sees that the feedback was heard.

No.	Comment received (in the reviewer's words)	Kind	Decision	What changed, and where in the brief
1.	"Which 18 months? Say the dates."	Clarity	Accept	Section 2 now reads "April 2025 to September 2025, in the dispatch system".
2.	"The expensive error here is the false alarm, no recall alone will not protect you."	Substance	Accept in part	Section 3 adds a precision floor of 60% next to the recall target of 80%, with the cost of a call stated.
3.	"Use a neural network; it will be more accurate."	Substance	Rebut, with evidence	No change. 18 months of tabular records is too small, and the dispatchers must read the reason for each flag. Stated under the justification.
4.				

Three decisions are possible: accept and change, accept in part, or rebut with evidence. A rebuttal is a legitimate answer when it is argued; silence is not.

Machine Learning and AI in Business - Capstone

Project pack, page 8 of 10

PACK page 8: Response-to-reviewer table: what changed, and why

Block 3 Question 3 of 3

Two drafts. Draft one scores 3, 3, 3, 3. Draft two scores 4, 4, 4, 1.

Which one should worry its author more, and why?

A

Draft one, because it never reaches level 4.

B

Draft two, because a section at level 1 means one of the four red flags is up, and a reviewer will send it back however strong the other three are.

C

Neither. Both total 12 or more.

D

Draft two, because the total is lower.

40 seconds

Submission checklist: before you press send

- | | |
|---|---|
| ☐ The brief is one page. Nothing is on page two except the attachments. | ☐ Section 1 names a prediction, a population, a window and a decision with an owner. |
| ☐ Section 2 names records that exist, with period and location, and what is still missing. | ☐ Section 3 has a number, and the measure follows the cost of the two errors. |
| ☐ Section 4 names the likeliest failure in business terms, and one safeguard. | ☐ The algorithm is justified underneath, in four parts, with one rejected alternative. |
| ☐ The evaluation matrix is attached: data, interpretability, cost, value. | ☐ The response-to-reviewer table is attached, one row per comment received. |
| ☐ Every comment has a kind and a decision, and every decision has a reason. | ☐ The file name carries your name and the date. |

Hard deadline: Saturday 10 October 2026. Draft on 1 October, two peer reviews by 4 October, revision by 8 October.

Machine Learning and AI in Business - Capstone

Project pack, page 10 of 10

PACK page 10: Submission checklist: before you press send

Your turn: score a draft against the rubric

Set a level for each criterion. The total, the weakest line and the comment it would draw are written out.

What you can move on screen

Clarity of problem framing 1: a goal or a technology, 2: a prediction, population or window missing, 3: one prediction, population, window, decision, 4: level 3 plus the owner and the action
Can a stranger say what one row of the output is?

Plausibility of data availability 1: wishes, no records named, 2: records named, no period or location, 3: records that exist, period, location, the gap, 4: level 3 plus the cost of the gap
Could every record named be opened on Monday?

Appropriateness of the success metric 1: no number, or accuracy on a rare event, 2: a number, costs ignored, 3: a number chosen from the two costs, 4: level 3 plus the tolerance in counts
Does the measure chase the expensive error?

Quality of risk identification 1: the model may not work, 2: a risk, not in business terms, 3: the likeliest failure, who pays, how it shows, 4: level 3 plus a safeguard on day one
Could someone act on it before the first error?

Try, in this order

1. As it opens: a typical first draft, 6 out of 16. Read the weakest line and the comment it would draw.
2. Raise the data line to level 3 by naming the records, the period and the location. Watch the total and the band.
3. Bring every line to level 3, then ask what level 4 would add to each. That list is your revision.

The point: The total is the least useful number on the panel. The weakest line is the one to fix first.

The levels are the rubric page of the pack. The bands (send it back, nearly there, ready for review) are a self-check, not the grade.

Three things from this block

2 A single level 1 is a red flag that sends the brief back.

3 The self-check finds the work; the instructor sets the grade.

Business project paper				
The rubric: four criteria, four levels				
Criterion	Level 1	Level 2	Level 3	Level 4
Clarity of problem framing	A goal, or a wish, or a purpose, or a question	A problem is mentioned but the question is not clear	One problem, one variable, one method	One problem, one variable, one method, one use of the statistical test
Feasibility of data availability	Nothing, no records named	Records named, but no source, or a source in answer book	Records that match, with general and specific	Records that match, with a clear measure named
Appropriateness of the statistical tests	No number, or arbitrary in a one-tailed test	A number, but the measure is not named, and the use of the test is wrong	A number and a measure named, but the use of the test is wrong	A number and a measure named, and the use of the test is correct (e.g. in 1-tailed tests)
Quality of the interpretation	Nothing, or a misleading use of words	Nothing, or a misleading use of words in business terms	One or two sentences, but the use of the test is wrong	One or two sentences, but the use of the test is correct (e.g. in 1-tailed tests)

PACK page 5: The rubric: four criteria, four levels

Submission checklist: before you press send

- The brief is on a page, nothing on a page but less except the attachments.
- Section 1 names a problem, a population, a predictor, a window and a decision with an answer.
- Section 2 names the features used, with: period and location, and what is still ongoing.
- Section 3 names the Statistic feature in business terms, and one sub-goal.
- The evaluation matrix is attached, data, interpretability, cost, value.
- Every comment has a reason and a decision, and every decision has a reason.
- Section 1 names a prediction, a population, a window and a decision with an answer.
- Section 2 names the features used, and the measures for the loss of the best answer.
- The algorithm is justified underneath, in four parts, with one optional alternative.
- The response-to-reviewer table is attached, one use per comment received.
- The file name carries your name and the date.

Hard deadline: Saturday 12 October 2020. Chat on 1 October, peer review by 6 October, review by 8 October.

PACK page 10: Submission checklist: before you press send

Create project page

The timeline, day by day

Date	What happens?	What you need or receive
Saturday 26 September	Session 6: the capstone workshop. Choose your problem if you have not.	Nothing due.
Sunday 27 to Wednesday 30 September	Write the final. Say no more; someone needs to someone who knows the business.	Draft of program.
Thursday 1 October	Draft deadline. Two classmates receive their draft - you receive theirs.	You must draft their evaluation material.
Friday 2 to Saturday 3 October	Rewrite the two drafts only, once each. Fill in the form, a letter for each reviewer, at least four handwritten suggestions each.	Reviews in progress.
Sunday 4 to Tuesday 7 October	Peer assessment. Draft 2.	You send two written forms, you receive three.
Wednesday 8 October	Final comments. Delivery or submission. Decide: accept, accept in part, or fail with extensive feedback.	Responses sent to programs.
Thursday 9 October	Revision deadline.	You send two written forms, you receive three.
Friday 10 October	Fair submissions. Next deadline.	You send final letter, final, response letters.

PACK page 6: The timeline, day by day

Block 4 of 4

Peer review as quality control

Project pack

10 minutes

Two strangers read your page cold. What they cannot follow, your future stakeholders will not follow either.

In this block: the one idea, a story, three things to keep, three questions, your turn, and three things from the block. All 10 pages of the project pack are in the professor's edition.

Pages from the project pack

Customer project packs

Peer review form: one per brief you review

Read the brief once, then, before you write anything, 'You are the manager the brief has to work for.'

Clarity

Did you find this sentence "The idea may be fine, but the writing isn't the media." The editor changes the idea, in addition to its substance.

Level 1
out of 5

1. I do find this sentence "The idea may be fine, but the writing isn't the media." The editor changes the idea, in addition to its substance.

2.

3.

4.

5.

Substance

"This measure will not treat what you claim." The measuring is challenged. The editor changes the idea, in addition to its substance.

1.

2.

3.

4.

5.

A suggestion is specific when it names the idea, states what is wrong, and what would be a "better 2 or even a 3"

1. I suggest "There's a focus on general 'any' about 10 months, and where the records sit."

2.

3.

4.

5.

PACK page 7: Peer review form: one per brief you review

Response-to-reviewer table: what changed, and why

Every comment you received gets a row. The table gets with the revised draft on 10 October, and the final on 10 October. It is how the reviewers and you worked gets a record.

No.	Comment received (in the reviewer's words)	Decision	Accept	Decline	What happened, and where in the text?
1	"Which I've mentioned" has the dates.	Clarify	Accept	Decline	Section 1 now shows "April 2018 to September 2018, in the dispatch window."
2	"The expensive error rate in the table above, to total above will not present."	Substantiate	Accept or in part	Decline	Section 1 adds a position below of 100 million in the small target of error, with the cost of all errors.
3	"Use a neural network, it will be more accurate."	Rebuttal	Decline	Accept	No change. 18 studies of neural networks to be listed, and the discussion should be added to the next to the next. Read under the publication.

4

These decisions are possible: accept and change, accept in part, or refuse with evidence. Available is a lighter version when it is agreed, revised or not.

Machine Learning and AI Research - Data Science

Practical Machine Learning

PACK page 8: Response-to-reviewer table: what changed, and why

Submission checklist: before you press send

- ☐ The title of your paper. Nothing on the page has escaped the attention of our reviewers.
- ☐ Section 1 names a prediction, a population, a timeline and a decision with an answer.
- ☐ Section 2 names records that exist, with personal and location, and place it all in context.
- ☐ Section 3 names the first decision in business terms, and is well supported.
- ☐ The evaluation matrix is attached, clear, interpretable, cost, value, metric.
- ☐ Every comment has a kind and a decision, and every decision has a kind.
- ☐ Section 4 names a number, and the measure follows the lead of the last review.
- ☐ The algorithm is a justified conclusion, in four parts, with one required alternative.
- ☐ The response-to-alternative table is attached, one row per comment received.
- ☐ The file name carries your name and the date.

Hard deadline: Saturday 12 October 2020. Draft on 1 October, peer reviews by 4 October, revision by 5 October.

PACK page 10: Submission checklist: before you press send

A reviewer's confusion is data. The job is to find out whether the writing lost them or the reasoning did.

Two very different things can be meant. Either the sentence is unclear and the idea is fine, or the idea is wrong and the sentence is fine. Rewriting when the idea is wrong changes nothing; changing the idea when the sentence was the problem throws away good work.

“This measure will not track what you claim.”

Substance. The reasoning is challenged, and the answer is either a change to the idea or a defence with evidence. Both are legitimate rows in the response table; silence is not.

the word: **substance feedback**

Four criteria, at least two suggestions each, every suggestion specific enough to act on. Then the author sorts, decides and changes, and writes down what changed.

Capstone project pack

Peer review form: one per brief you review

Read the brief once, add 'works' before you write anything. (You can change the brief box to work for you.)

Mark each suggestion with its kind

Criticism	Level 1 or 2	Yes, suggestions are useful enough to act on	Clarity
Clarity of problem framing	1 2		Clarity You say how the brief is 'problematic'. The idea here is to get the writing into the brief to make the reviewer clearer.
Feasibility of data availability	1 2		Substance This measure will not track what you claim. The measuring is challenging. The reviewer changes the idea, or defends its challenge.
Appropriateness of the economic model	1 2		
Quality of identification	1 2		A suggestion is specific when it names the idea, says what it wants and says what would be the result. For example, "The model is wrong" is not a suggestion. "Suggest 7 tonnes per acre instead of just 10 tonnes, and when the results are 10"

PACK page 7: Peer review form: one per brief you review

Response-to-reviewer table: what changed, and why

Every comment you received gets a row in the revised final on 8 October and with the final on 10 October. It is the final grade scores that the feedback was based.

No.	Comment received (in the comments to review)	Kind	Decision	What changed, and where in the manuscript
1	"Add a link to review by the dates."	Clarity	Accept	Added a new sub-paragraph in September 2018, on the "discovery" section.
2	"The explanation about the first paper, on social stress and first paper."	Substance	Accept in part	Clarified a point: a previous claim of 10% was the most popular of 10%, not the cost of a claim.
3	"Social network model, it will more accurate."	Substance	Noted, with evidence	No change. 13 months of behavior research is too small, and the disconnection must meet the reason for the signal. Based on the population.

Four decisions are possible: accept and change, accept in part, or reject with evidence. It is noted in a publication when it is accepted, when it is not.

Machine Learning and AI in Business - Cyber Security

PACK page 8: Response-to-reviewer table: what changed, and why

What you hand in, and when

1	2	3	4
Thursday 1 October Draft first page, four sections, and your evaluation notes attached to each section	Sunday 4 October Two peer-review sections and related, using the four peer-review criteria, at least four suggestions each	Wednesday 8 October Revised text, with the response to peer-review clearly changed and why	Thursday 10 October Final text submitted for grading (read deadline, 10.45 after Session 5)

The envelope on 10 October

The first text, one page, four sections.

The second, half the first text, also, (revisability, cost, value) as the evidence is built in.

The third, one page (your comment) you received, what text, it was, what did it do.

How it is graded

Clarity of problem framing. Quality of reasoning, use of the course materials. Demonstrable integration of the feedback you received. The rubric on page 3 spells out what text and how to do it.

Machine Learning and AI in Business: Cyber Risk

Printed on: June 2 of 20

PACK page 2: What you hand in, and when

The second measurement that nobody wanted to hear, 1990

Step 1

24 April 1990

The Hubble Space Telescope is launched after years of work and a cost measured in billions. Its main mirror had been polished to an extraordinary precision.

Step 2

27 June 1990: the blur

NASA announces that the images are flawed. Both cameras show the same distortion, so the problem is in the mirrors, not the cameras.

Step 3

The test that was trusted alone

A board of investigation finds that the mirror is too flat near its edge, by about ten times the allowed tolerance. The device used to check its shape during polishing had been set up incorrectly.

Step 4

The second test that was set aside

Other measurements during manufacture had disagreed with the main test. The disagreement was put down to the lesser instrument being less accurate, and was not investigated.

Step 5

December 1993

Astronauts fit corrective optics in orbit and the telescope works as designed. The lesson the board drew is the reviewer's lesson: a second reading that disagrees with yours is the most valuable data you have, not an annoyance to explain away.

Three things to keep

1 Read the brief cold, once, before writing anything. You are the stranger it has to work for.

2 Mark every suggestion: clarity or substance. The author responds to each differently.

3 Three decisions for the author: accept, accept in part, rebut with evidence. Every row gets a reason.

Customer project pack

Peer review form: one per brief you review

Read the brief once, cold, before you write anything. You use the template the brief has to work for.

Criterion	Level 1 or 4	Two suggestions, each describes enough to act on
Clarity of problem framing	4	
Feasibility of data availability	2	
Appropriateness of the intervention	2	
Quality of risk identification	2	

Mark each suggestion with its kind

Clarity
To be clear follow this sentence: "The idea may be fine, the writing not for me." The author responds.

Substance
This response will not help what you claim? The reasoning is inadequate. The author changes the idea, or defends each evidence.

A suggestion is specific when it names the idea, says what is wrong, and says what needs to be done. It is clear if it is a suggestion. "Review 1 focuses on period: say which 18 months, and where the research is."

Decision Learning and AI in Business: Explanatory

Project pack: page 14 of 15

PACK page 7: Peer review form: one per brief you review

Customer project pack

Response-to-reviewer table: what changed, and why

Every comment you received gets a row. The table goes with the revised brief on 8 October and with the final on 10 October. It is how the grade goes for the brief, not the brief.

No.	Comment received in the reviewer's email	Kind	Decision	What changed, and where in the brief
1	"Which 18 months? Say the dates."	Clarity	Accept	Section 2 now reads "April 2018 to September 2019, in the 'Report' column."
2	"The expenditure error item in the data table, in total, does not add up to zero."	Substance	Accept in part	Section 2 adds a precision floor of 50% more in the total error of 10% with the rest of a cell added.
3	"The model network, it will be more accurate."	Substance	Rebut with evidence	Rebuttal: 18 months of data, more in the model, and the response to reviewer table is attached, one row per comment received.
4				

Three decisions are possible: accept and change, accept in part, or reject with evidence. It is added to a table to answer when it is rejected, done to no.

Decision Learning and AI in Business: Explanatory

Project pack: page 15 of 15

PACK page 8: Response-to-reviewer table: what changed, and why

Customer project pack

Submission checklist: before you press send

☐ The brief is one page. Nothing is on page this except the attachments.	☐ Section 1 names a prediction, a population, a window and a decision with an error.
☐ Section 2 names records that exist, with period and location, and what is self-referencing.	☐ Section 3 has a table, and the measure follows the cost of the loss error.
☐ Section 4 names the dataset before in business terms, and one paragraph.	☐ The algorithm is justified underneath, in four parts, with one required alternative.
☐ The evaluation matrix is attached, data, interpretability, and, which.	☐ The response-to-reviewer table is attached, one row per comment received.
☐ Every comment has a kind and a decision, and every decision has a reason.	☐ The file name carries your name and the date.

Hard deadline: Saturday 10 October 2019. Draft on 1 October, two peer reviews by 4 October, revision by 8 October.

PACK page 10: Submission checklist: before you press send

Block 4 Question 1 of 3

A reviewer writes, under the data criterion: section 2 is weak.

Why does the form not accept that as a suggestion?

A

Because it is unkind.

B

Because it names no line, says nothing about what is wrong, and gives the author nothing to do.

C

Because reviewers may only comment on section 1.

D

Because it is too short; suggestions must be a paragraph.

40 seconds

Type the letter in the Zoom chat

The answer is discussed in the session.

Pages from the project pack

Capstone project pack

Peer review form: one per brief you review

Read the brief once, cold, before you write anything. You are the stranger the brief has to work for.

Criterion	Level 1 to 4	Two suggestions, each specific enough to act on
Clarity of problem framing	1. 2.	
Plausibility of data availability	1. 2.	
Appropriateness of the success metric	1. 2.	
Quality of risk identification	1. 2.	

Mark each suggestion with its kind

Clarity
"I do not follow this sentence." The idea may be fine; the writing lost the reader. The author rewrites.

Substance
"This measure did not track what you claim." The reasoning is challenged. The author changes the idea, or defends it with evidence.

A suggestion is specific when it names the line, says what is wrong, and says what would fix it. "Section 2 is weak" is not a suggestion. "Section 2 names no period, say which 18 months, and where the records sit" is.

Machine Learning and AI in Business Cyber Skills

Project pack, page 7 of 10

PACK page 7: Peer review form: one per brief you review

Capstone project pack

The four sections, and the test each one has to pass

1 Task type What does the model predict, and for whom? Name the categories, the number or the graphs. Test: a stranger can say what one row of the answer looks like. Red flag: a goal in place of a prediction.	2 Data What exists today, where it sits, which period it covers, and whether the past copies carry the answer. Then what is still missing. Test: every record named could be opened on demand. Red flag: values instead of records.	3 Success measure How good is good enough, as a number, with the cost of each kind of error behind it. Test: it can be calculated every week with a count. Red flag: no number.	4 Main risk The most likely way this fails, in business terms, and the safeguard that follows from it. Test: someone could tell on it before the first error. Red flag: "performance may dip" or "may rise".
--	---	---	--

The brief deliberately does not name the algorithm. The justification for the algorithm and for the measure goes underneath the four sections, in four short parts: the choice and why, the measure and the cost difference behind it, the trade-offs accepted, and a plain-language summary.

Machine Learning and AI in Business Cyber Skills

Project pack, page 3 of 10

PACK page 3: The four sections, and the test each one has to pass

A reviewer writes: use a neural network, it will be more accurate. The author has 18 months of tabular records and a dispatch desk that acts on the list.

What is the right row in the response table?

A

Substance; accept; change the algorithm.

B

Substance; rebut with evidence; no change, and the evidence stated: tabular data, a modest volume, and a desk that acts on the list, not on the reason.

C

Clarity; accept; reword the sentence.

D

Ignore it, because the reviewer is not the instructor.

45 seconds

Type the letter in the Zoom chat

The answer is discussed in the session.

Peer review form: one per brief you review

Read the brief once, cold, before you write anything. You are the stranger the brief has to work for.

Criterion	Level 1 to 4	Two suggestions, each specific enough to act on
Clarity of problem framing	1. 2.	
Plausibility of data availability	1. 2.	
Appropriateness of the success metric	1. 2.	
Quality of risk identification	1. 2.	

Mark each suggestion with its kind

Clarity
"I do not follow this sentence." The idea may be fine; the writing lost the reader. The author rewrites.

Substance
"This measure did not track what you claim." The reasoning is challenged. The author changes the idea, or defends it with evidence.

A suggestion is specific when it names the line, says what is wrong, and says what would fix it. "Section 2 is weak" is not a suggestion. "Section 2 names no period: say which 18 months, and where the records sit in."

Machine Learning and AI in Business Cyber Skills Project pack, page 7 of 10

PACK page 7: Peer review form: one per brief you review

Both reviewers flag the same sentence in section 4, but one calls it unclear and the other says the risk named is not the likeliest one.

What should the author do first?

A

Rewrite the sentence, since both flagged it.

B

Ask a clarifying question of each reviewer, or reread the two comments as two different kinds: one clarity, one substance, each needing its own decision.

C

Delete section 4.

D

Follow the reviewer with the higher score.

40 seconds

Type the letter in the Zoom chat

The answer is discussed in the session.

Response-to-reviewer table: what changed, and why

Every comment you received gets a row. The table goes with the revised brief on 8 October and with the final on 10 October. It is how the grade sees that the feedback was heard.

No.	Comment received (in the reviewer's words)	Kind	Decision	What changed, and where in the brief
1.	"Which 18 months? Say the dates."	Clarity	Accept	Section 2 now reads "April 2025 to September 2025, in the dispatch system"
2.	"The expensive error here is the false alarm; no recall alone will not protect you."	Substance	Accept in part	Section 3 adds a precision filter of 60% next to the recall target of 80%, with the cost of a call stated.
3.	"Use a neural network; it will be more accurate."	Substance	Rebut, with evidence	No change. 18 months of tabular records is too small, and the dispatchers must read the reason for each flag. Stated under the justification.
4.				

Three decisions are possible: accept and change, accept in part, or rebut with evidence. A rebuttal is a legitimate answer when it is argued; silence is not.

PACK page 8: Response-to-reviewer table: what changed, and why

Your turn: sort the feedback and fill the table

Four comments on the courier brief. Decide what kind each one is and what you do about it; the response table is written out on the right.

What you can move on screen

Comment 1: kind and decision Clarity: accept and change, Clarity: accept in part, Clarity: rebut with evidence, Substance: accept and change, Substance: accept in part, Substance: rebut with evidence

"I do not follow the second sentence of the data section."

Comment 2: kind and decision Clarity: accept and change, Clarity: accept in part, Clarity: rebut with evidence, Substance: accept and change, Substance: accept in part, Substance: rebut with evidence

"Recall alone will not protect you; you also need a precision floor."

Comment 3: kind and decision Clarity: accept and change, Clarity: accept in part, Clarity: rebut with evidence, Substance: accept and change, Substance: accept in part, Substance: rebut with evidence

"Which 18 months? Say the dates and where the records sit."

Comment 4: kind and decision Clarity: accept and change, Clarity: accept in part, Clarity: rebut with evidence, Substance: accept and change, Substance: accept in part, Substance: rebut with evidence

"The model may degrade is not a risk anyone can plan for."

Try, in this order

1. As it opens, every comment is read as clarity and accepted. Read how many kinds match the video's reading.
2. Set comments 2 and 4 to substance. Now look at comment 3 and decide: is it asking for a rewrite or for a change of idea?
3. Rebut one comment. The row changes; a rebuttal only counts when the evidence is written in the last column of the real table.

The point: Sorting comes before changing. A clarity comment costs a sentence; a substance comment costs a decision, and either way the row has to say why.

The four comments are written for the worked example. The kind the video would give each one is shown in the table so you can compare your reading with it.

Three things from this block

1

Read cold, then write suggestions that name the line, the fault and the fix.

2

Clarity comments change the writing; substance comments change or defend the idea.

3

Every comment gets a row, a kind, a decision and a reason. That table is part of the grade.

Pages from the project pack

PACK page 8: Response-to-reviewer table: what changed, and why

PACK page 10: Submission checklist: before you press send

PACK page 7: Peer review form: one per brief you review

Your next fourteen days

- Sunday to Wednesday: write the draft. Say the one-sentence scope to someone who knows the business.
- Thursday 1 October: send the draft with the evaluation matrix attached.
- Friday and Saturday: read your two classmates' briefs cold, once each, and fill in the two forms.
- Monday to Wednesday: sort the comments, fill the response table, then revise.

From here: There is no next live session. The pack, the template, the forms and the workbook are on the course page. Questions go to the WhatsApp number you already have.

What is assessed, and when

What	Weight	When
Draft brief plus evaluation matrix	Part of 50%	Thursday 1 October 2026
Two peer reviews written	Part of 50%	Sunday 4 October 2026
Revised brief plus response table	Part of 50%	Wednesday 8 October 2026
Final brief submitted	50% in total	Saturday 10 October 2026, hard deadline
Attendance and participation	10%	Recorded at each live session, including Session 6
